

Legend: **==** Salesforce data via Jetstream server Salesforce data direct to Salesforce (never touches Jetstream)
Crash reports go from each app straight to Better Stack (never via the Jetstream server) and carry no Salesforce record data or credentials.
Anthropic only sees what staff choose to analyze: log, crash-report and support-request excerpts, and account records. No model training.

Salesforce Data Residency by Product Surface

Product Surface	Salesforce data through Jetstream servers?	Where Salesforce credentials live	Credential protection	What the Jetstream server handles	Crash / error reporting (Better Stack)
Web App (browser)	YES proxied through server memory; not persisted	Jetstream database (cloud)	AES-256-GCM, per-user PBKDF2-derived key	App UI + Salesforce API proxy + account auth	Browser + server report errors No per-user opt-out
Browser Extension (Chrome / Firefox)	NO browser talks to Salesforce directly	Live Salesforce session cookie (browser)	N/A reuses the user's existing Salesforce session	Account auth + entitlement + optional history sync	Extension UI pages only (no content script / service worker) Opt-out: Additional Settings
Desktop App (Electron)	NO app talks to Salesforce directly	User's computer (encrypted orgs.json)	AES-256-GCM, user-derived key (held in memory)	Auth + encryption-key delivery + app-data sync	Renderer + main process report errors Opt-out: Help menu checkbox
Managed Package (Salesforce Canvas)	NO browser talks to Salesforce via Canvas SDK	Not stored token from Salesforce signed request each session	N/A token issued by Salesforce at load	Signed-request verification + static asset delivery	Iframe reports errors (CSP allow-lists the ingest origin) No per-user opt-out

Crash / error reports carry the error message, stack trace, app version and the signed-in user's ID and email — never Salesforce record data, credentials or tokens. Each app sends them straight to Better Stack (they do not pass through Jetstream servers); server-side reports are additionally redacted, and there is no session replay or performance tracing on any surface.

Personal Data (PII) — What Jetstream Stores and How It Is Protected

Baseline for everything below: the entire production database is encrypted at rest.
The colors indicate the ADDITIONAL, application-level protection applied on top of encryption at rest.

Personal data Jetstream stores about its USERS — PostgreSQL (encrypted at rest)

Account identity
email, name, nickname, avatar URL

Salesforce identity
SF username, email, instanceUrl

Login & audit activity
IP address, user-agent, email
(retention 365 / 180 days)

Sessions
user, IP, user-agent
(server-side; httpOnly cookie)

Passwords
bcrypt — one-way hash
(never stored reversibly)

MFA / TOTP secrets
additional field-level AES-256-GCM

SSO secrets
SAML key / OIDC secret
additional field-level AES-256-GCM

Salesforce OAuth tokens
(web app only)
additional field-level AES-256-GCM, per-user key

Billing
Stripe customer / subscription IDs only
(no card data — Stripe holds all payments)

Salesforce RECORD data — the customer's data (may contain PII)

Web app
proxied through server memory
NOT persisted by Jetstream

Extension · Desktop · Canvas
never touches Jetstream servers

Personal data sent to a SUB-PROCESSOR — crash & error reports (Better Stack). Not held in the Jetstream database; sent by the app only when something fails.

Who the report is attributed to
Jetstream user ID + email
(Canvas: Salesforce user ID + email)
server-side reports also include IP + user-agent

What the report contains
error message, stack trace, breadcrumbs,
app version, environment, browser/OS

Never included
Salesforce record data · Salesforce or Jetstream credentials
No session replay, no performance tracing
server payloads redacted by key name before send

User control: Desktop — "Send crash reports to Jetstream" checkbox in the Help menu · Browser Extension — same toggle in Additional Settings (both on by default)
Web app and Canvas have no per-user toggle. Reports go from each app directly to Better Stack — never through Jetstream servers — and are volume-limited per session/user.

Personal data staff may share with a SUB-PROCESSOR — Anthropic (Claude). Staff-initiated: never sent by the app.

Excerpts of server logs, crash reports and support requests, and Jetstream account records, analyzed for troubleshooting and internal operations.
Commercial terms (DPA with SCCs) prohibit model training. Anthropic is listed on the public sub-processor page.

Additional application-level protection — Blue: personal data (encrypted at rest, used by the app) Green: additionally field-level encrypted Purple: one-way hashed Amber: delegated / not stored
